

CONFIDENTIAL CONCEPT PITCH · 2026

Party Mode

Turn JioSaavn into the DJ
at every Indian party.

A premium feature concept, backed by a working prototype.

Rishi · rishinikamai@gmail.com

THE PROBLEM

The “DJ Gap”

Every party song has a peak. The second it ends and the next track starts cold, the dance floor dies and stays dead through the intro.

Chaiyya Chaiyya (7:00)

0:00-0:54

PEAK · 0:54-1:54

1:54 onwards, energy drops

Kajra Re (6:00)

0:00-1:00

PEAK · 1:00-2:20

2:20 onwards

≈ 1 min 6 sec of dead dance floor between two bangers.

Nobody dances to an intro.

THE INSIGHT

**Every song has a peak.
People only want the peaks.**

At a party, listeners want the bangers, back to back, blended smoothly. That is exactly what a DJ does by hand: cut the filler, ride the energy, never let the room cool down.

The peak is already measurable: it's the most-replayed, highest-energy stretch of the track.

THE SOLUTION

Party Mode: one toggle, **zero dead air.**

- Flip **Party Mode** on inside JioSaavn.
- The app auto-plays each song's **peak section** and **crossfades** straight into the next song's peak.
- No requests, no buildup, no buzzkill. Continuous, DJ-style energy.

A DJ in every pocket.

“Groovy”: a working prototype

What it does today

- Stores each song’s peak (**in / out** timestamps).
- **Auto-skips** the moment the peak ends.
- **Seeks** the next song straight to its peak.
- Schema already built for crowd/AI-derived peaks (confidence scoring).

The wall I hit

It runs on Spotify, and **Spotify’s API exposes no crossfade control**. So transitions stay glitchy. I can skip and seek, but I can’t blend. I’ve hit a ceiling I cannot break from the outside.

WHY JIOSAAVN, NOT ME, SHOULD OWN THIS

You can do the one thing I can't.

- JioSaavn **owns its own player** → full crossfade & gapless control.
- JioSaavn owns the **Indian catalog** and the **party-culture audience**.
- JioSaavn has **no public API**, so no third party can build this from outside. **Only you can.**

You already own the two things Spotify won't hand me.

Find the peak **without** expensive AI.

① Crowdsourced behavior

You already log where users **skip, replay, and seek** across millions of streams. Aggregate it into a per-song **average in-point / out-point**. The peak reveals itself.

② No LLM required

Simple **statistical aggregation + filtering**, with an optional light audio-energy pass. Cheap to compute, and it gets **smarter with every stream**.

The data already lives on your servers. It's just never been mined for this.

WHY NOW

Spotify built the *mixtape*. Nobody's built the DJ.

Spotify just shipped “**Mix**,” but that recreates the sentimental personal mixtape: songs for a loved one. It is **not** the party, and **not** the DJ.

The party floor is wide open. First mover owns the category.

The real market: **casual house parties.**

Not weddings; those hire a DJ. The everyday apartment, dorm, and pre-game party is where music runs off a phone, and where there's no DJ to save the vibe.

- **Huge & constant:** happens every weekend, in every city, with zero booking or budget.
- **High-intent, high-spend moment:** people in party mode pay for anything that keeps the night going, and Party Mode is exactly that.
- **Inherently viral:** one party exposes a whole room of friends at once → word-of-mouth acquisition.
- **Converts & sticks:** a premium reason to upgrade, longer sessions, clean differentiator vs. Spotify & YouTube Music.

HOW IT WORKS

One lightweight pipeline.

Mirrors my proven prototype schema (a “peaks” table with in-time, out-time & confidence score).

PHASED ROLLOUT, LOW RISK

Ship it in three steps.

Phase 1

Crowd-derive peaks for the top 10,000 party songs. Pure data work, no player changes.

Phase 2

Crossfade / gapless engine in the player, gated to the peak segments.

Phase 3

Party Mode toggle + group / social party sessions (shared queues, multi-room).

THE ASK

I built a prototype **and tested it** at real parties.

I've been using Groovy at college dorm parties and frat parties. It works; the energy stays up. I have screen recordings of each transition: the song that ends, the song that starts, and where the peaks land.

If this sounds interesting, I'd be happy to share the recordings or walk you through how it works. I'm not pitching myself, just the idea. If JioSaavn ships this, everyone wins.
